EDUCATION

Washington University in St. Louis

Bachelor of Science in Computer Science

St. Louis, MO

Aug 2024 – May 2028

EXPERIENCE

Oracle – Oracle Cloud Infrastructure (OCI)

Software Engineering Intern, Cloud Safety Team

Nashville, TN

May 2026 – Aug 2026

- Built a Django feature for an internal hazard-tracking tool that renders weekly reports into customizable Slack Block Kit messages for executives, with payload validation, three checks before any live post, and 86 unit tests
- Reproduced a bug in an internal deployment system that could leave two copies of an application running after a deploy, then wrote the after-action report proposing a fix and a way to detect it automatically
- Owned triage of 13 infrastructure hazards across more than 10 OCI service teams, chasing each one down to a named owner and evidence that the fix actually worked
- Prototyped a pipeline that scraped and de-identified 1M+ public Oracle Forums posts for an internal harm-review tool, classifying them by harm type and severity to find problems customers never filed tickets about
- Added the harm-review tool's first accessibility support, testing keyboard and screen-reader flows in a CLI browser

Habitat Financial

Software Engineer

St. Louis, MO

Jul 2025 – Present

- Lead engineer on JukeHouse.FM, a Django/PostgreSQL publishing platform that automates registering a songwriter's catalog with collection societies instead of filing with each one by hand
- Registered JukeHouse as a publisher with ASCAP, BMI, and The MLC, then built its CWR 2.1/3.0 generator and validator that packages each work into the format those societies require
- Designed its deployment architecture: Docker on Railway with PostgreSQL, Redis, and Celery for asynchronous royalty jobs, and S3-backed media storage

Software Development Intern

May 2025 – Aug 2025

- Developed full-stack interfaces (Django, PostgreSQL, HTMX, JavaScript) for album/artist management, revenue tracking, and financial reporting for 120+ client teams across 486K+ track records
- Implemented royalty pipelines that normalize territories, stores, and currencies from raw CSV files, then apply deal terms, splits, and tax to produce artist earnings across 5,000+ statements to date

PROJECTS

Trellofy | *React, Vite, Express, MongoDB*

Dec 2025

- Built a full-stack Kanban application with JWT-authenticated multi-user boards and per-board access control
- Implemented drag-and-drop card and list reordering over a position-indexed MongoDB schema that atomically shifts every affected document on each move, keeping board order consistent under concurrent edits

Multi-Room Chat Server | *Node.js, Socket.io, AWS (EC2)*

Nov 2025

- Developed a real-time multi-room chat server with password-protected rooms, creator-based moderation (kick/ban), and automatic ownership transfer on creator disconnect
- Added private messaging, live message reactions, and input sanitization to prevent XSS, then deployed it persistently on AWS EC2 under PM2

NutriScan | *Python, Streamlit, OpenAI API, Foodvisor API*

Oct 2024

- Owned the Foodvisor-API image-analysis layer on a 3-person team during a 24-hour WashU hackathon, decomposing food photos into 15 tracked nutrient fields per detected ingredient
- Shipped the food-journal feature and integrated it with teammates' calorie-tracking and recipe modules

TECHNICAL SKILLS

Languages: Python, JavaScript, SQL, Java, C, C++, HTML/CSS

Frameworks & Tools: Django, React, Node.js, Express.js, Celery, Redis, PostgreSQL, MongoDB, Docker, AWS (EC2, S3), Git, Pytest
